The *noun* has one meaning:

Meaning #1: a compound derived from ammonium with hydrogen atoms replaced by organic groups; used as:

Wikipedia: quaternary ammonium cation

Quaternary ammonium

cation. Any or all of the R groups may be the same or different alkyl groups. Also, any of the R groups may be connected.

Quaternary ammonium cations, also known as **quats**, are positively charged polyatomic ions of the structure NH_4^+ itself and primary, secondary, or tertiary ammonium cations, the quaternary ammonium cations are present in solution. Quaternary ammonium cations are synthesized by complete alkylation of ammonia or other amine.

Quaternary ammonium salts or **quaternary ammonium compounds** are salts of quaternary ammonium cations. They are used as surfactants, fabric softeners, and as antistatic agents (e.g. in shampoo). In liquid fabric softeners, the chloride salts are often used. This is also a common ingredient in many spermicidal jellies.

In organic chemistry, quaternary ammonium salts are used as phase transfer catalysts for reactions involving dichlorocarbene with chloroform and sodium hydroxide.

The synthesis of this cation from ammonia is referred to as **quaternization**.
